

## power series

The power series is a series of the form

$$\sum_{n=0}^{\infty} c_n x^n = c_0 + c_1 x + c_2 x^2 + \dots$$

In general,

$$\sum_{n=0}^{\infty} c_n (x-a)^n = c_0 + c_1 (x-a) + c_2 (x-a)^2 + \dots$$

this is called power series about the point  $a$   
or centered at  $a$ .

where  $c_0, c_1, c_2, \dots$  are constants called co-efficients  
of the power series.

Suppose a function  $f(x)$  satisfies the following 2 conditions:

1)  $f(x)$  and its first  $(n-1)$  derivatives are continuous  
in a closed interval  $[a, b]$

2)  $f^{(n-1)}(x)$  is differentiable in open interval  $(a, b)$ .

Then  $\exists$  Taylor series expansion for the given function  
 $f(x)$  in powers of  $(x-a)$  or about the point 'a'.

Suppose

$$f(x) = \sum_{n=0}^{\infty} c_n (x-a)^n = c_0 + c_1 (x-a) + c_2 (x-a)^2 + c_3 (x-a)^3 + \dots \quad \text{--- ①}$$

$$\text{put } x=a, \quad c_0 = f(a)$$

$$\text{Diff}^t \text{ ① w.r.t } x \quad f'(x) = c_1 + 2c_2(x-a) + 3c_3(x-a)^2 + \dots$$

$$\text{put } x=a, \quad c_1 = f'(a)$$

$$4c_4(x-a)^3 + \dots$$

$$\text{Diff}^t \text{ ② w.r.t } x \quad f''(x) = 2c_2 + 3 \cdot 2 \cdot c_3(x-a) + 4 \cdot 3 \cdot c_4(x-a)^2 + \dots$$

$$\text{put } x=a, \quad 2c_2 = f''(a)$$

$$c_2 = \frac{f''(a)}{2!}$$

$$\text{by } c_3 = \frac{f'''(a)}{3!}$$

$$\dots \dots \dots c_n = \frac{f^{(n)}(a)}{n!}$$

Equation (M) becomes, we get

$$f(x) = (1+x)^K = 1 + Kx + \frac{K(K-1)}{2!} x^2 + \frac{K(K-1)(K-2)}{3!} x^3 + \dots + \frac{K(K-1)\dots(K-(n-1))}{n!} x^{K-n} + \dots$$

$$(1+x)^K = \sum_{n=0}^{\infty} \binom{K}{n} x^n$$

where  $\binom{K}{n}$  is called binomial co-efficient.

$$\& \binom{K}{n} = \frac{K(K-1)\dots(K-(n-1))}{n!}$$

Note: 1)  $(1+x)^{-1} = 1 - x + x^2 - x^3 + \dots$

2)  $(1-x)^{-1} = 1 + x + x^2 + x^3 + \dots$

3)  $(1+x)^{-2} = 1 - 2x + 3x^2 - 4x^3 + \dots$

4)  $(1-x)^{-2} = 1 + 2x + 3x^2 + 4x^3 + \dots$

5)  $\sin x = x - \frac{x^3}{3!} + \frac{x^5}{5!} - \dots$

8)  $\tan x = x + \frac{x^3}{3} + \frac{2}{15} x^5 + \dots$

6)  $\cos x = 1 - \frac{x^2}{2!} + \frac{x^4}{4!} - \dots$

9)  $\sinh x = \frac{e^x - e^{-x}}{2} = x + \frac{x^3}{3!} + \frac{x^5}{5!} + \dots$

7)  $e^x = 1 + x + \frac{x^2}{2!} + \frac{x^3}{3!} + \dots$

10)  $\cosh x = \frac{e^x + e^{-x}}{2} = 1 + \frac{x^2}{2!} + \frac{x^4}{4!} + \dots$

11)  $\log(1+x) = x - \frac{x^2}{2} + \frac{x^3}{3} - \frac{x^4}{4} + \dots$

12)  $\tan^{-1} x = x - \frac{x^3}{3} + \frac{x^5}{5} - \frac{x^7}{7} + \dots$

### Example 1

① obtain the Taylor series expansion for  $\cos x$  about the point  $x = \frac{\pi}{3}$  up to fourth degree term. Hence determine the approximate value of  $\cos(61^\circ)$ .

Soln:-  $f(x) = \cos x$ ,  $f(\frac{\pi}{3}) = \cos(\frac{\pi}{3}) = \frac{1}{2}$   
Diff't  $f(x)$  w.r.t  $x$

$$f'(x) = -\sin(x), \text{ at } x = \frac{\pi}{3} \quad f'(\frac{\pi}{3}) = -\sin(\frac{\pi}{3})$$
$$f'(\frac{\pi}{3}) = -\frac{\sqrt{3}}{2}$$

Diff't  $f'(x)$  w.r.t  $x$

$$f''(x) = -\cos x, \text{ at } x = \frac{\pi}{3} \quad f''(\frac{\pi}{3}) = -\cos(\frac{\pi}{3})$$
$$f''(\frac{\pi}{3}) = -\frac{1}{2}$$

$$\text{III}^{\text{rd}} \quad f'''(x) = \sin(x), \text{ at } x = \frac{\pi}{3} \quad f'''(\frac{\pi}{3}) = \sin(\frac{\pi}{3}) = \frac{\sqrt{3}}{2}$$

$$f^{(4)}(x) = \cos(x) \text{ at } x = \frac{\pi}{3} \quad f^{(4)}(\frac{\pi}{3}) = \cos(\frac{\pi}{3}) = \frac{1}{2}$$

Taylor series expansion upto fourth degree term is

$$f(x) = f(a) + \frac{f'(a)}{1!}(x-a) + \frac{f''(a)}{2!}(x-a)^2 + \frac{f'''(a)}{3!}(x-a)^3 + \frac{f^{(4)}(a)}{4!}(x-a)^4$$

$$f(x) = \cos x = \frac{1}{2} - \frac{\sqrt{3}}{2}(x - \frac{\pi}{3}) - \frac{1}{2 \cdot 2!}(x - \frac{\pi}{3})^2 + \frac{\sqrt{3}}{2 \cdot 3!}(x - \frac{\pi}{3})^3 + \frac{1}{2 \cdot 4!}(x - \frac{\pi}{3})^4 \quad \text{--- ①}$$

$$61^\circ = 61 \cdot \frac{\pi}{180}$$

$$\text{put } x = \frac{61\pi}{180} \text{ in ①}$$

$$\cos(61^\circ) = \cos(\frac{61\pi}{180}) = 0.48$$

2) Obtain Taylor's expansion for  $f(x) = \log_e x$  up to the term containing  $(x-1)^4$  and hence find  $\log_e(1.1)$

Sol: The Taylor's series for  $f(x)$  about the point 1 is  
$$f(x) = f(1) + \frac{f'(1)}{1!}(x-1) + \frac{f''(1)}{2!}(x-1)^2 + \frac{f'''(1)}{3!}(x-1)^3 + \frac{f^{IV}(1)}{4!}(x-1)^4 + \dots \rightarrow \textcircled{1}$$

$$\text{Given:- } f(x) = \log_e x \quad \Rightarrow \quad f(1) = \log 1 = 0$$

$$f'(x) = \frac{1}{x} \quad \Rightarrow \quad f'(1) = 1$$

$$f''(x) = -\frac{1}{x^2} \quad \Rightarrow \quad f''(1) = -1$$

$$f'''(x) = \frac{2}{x^3} \quad \Rightarrow \quad f'''(1) = 2$$

$$f^{IV}(x) = -\frac{6}{x^4} \quad \Rightarrow \quad f^{IV}(1) = -6$$

$$\textcircled{1} \Rightarrow f(x) = \log_e x = 0 + (x-1) + \frac{(x-1)^2}{2!}(-1) + \frac{(x-1)^3}{3!}(2) + \frac{(x-1)^4}{4!}(-6) + \dots$$

$$\Rightarrow \log_e x = (x-1) - \frac{(x-1)^2}{2} + \frac{(x-1)^3}{3} - \frac{(x-1)^4}{4} \dots$$

Taking  $x = 1.1$  in the above expansion

$$\log_e(1.1) = (0.1) - \frac{(0.1)^2}{2} + \frac{(0.1)^3}{3} - \frac{(0.1)^4}{4} = 0.0953$$

3) obtain the maclaurin series expansion of the following function

$$y = \sin x$$

solve:- (a)  $y = \sin x$ ,  $y(0) = 0$

The Maclaurine series is given by

$$y = y(0) + \frac{y'(0)}{1!} x + \frac{y''(0)}{2!} x^2 + \frac{y'''(0)}{3!} x^3 + \dots + \frac{y^{(n)}(0)}{n!} x^n + \dots$$

Diff  $y$  w.r.t  $x$

①

$$y' = \cos x, \quad y'(0) = \cos 0 = 1$$

$$\text{ii}^{\text{nd}} \quad y'' = -\sin x, \quad y''(0) = -\sin 0 = 0$$

$$y''' = -\cos x, \quad y'''(0) = -\cos 0 = -1$$

$$y^{(4)} = \sin x, \quad y^{(4)}(0) = \sin 0 = 0$$

$$y^{(5)} = \cos x, \quad y^{(5)}(0) = \cos 0 = 1$$

① implies that

$$y = \sin x = 0 + \frac{x}{1!} + 0 - \frac{x^3}{3!} + 0 + \frac{1}{5!} x^5 - \dots$$

$$y = \sin x = x - \frac{x^3}{3!} + \frac{x^5}{5!} - \frac{x^7}{7!} + \dots$$

4) Expand  $y = \log(\sec(x))$  as a series in power of  $x$ , and hence obtain the series expansion for  $\tan(x)$ .

Sol:

$$\text{Here } y = \log[\sec(x)]$$

$$\Rightarrow y' = \frac{1}{\sec(x)} \cdot \sec(x) \cdot \tan(x)$$

$$y'' = \sec^2 x = 1 + \tan^2 x = 1 + y'^2$$

$$y''' = 2y' y''$$

$$y^{IV} = 2[y' y''' + (y'')^2]$$

$$\text{Put } x=0, \sec(0)=1 \Rightarrow \log(1)=0$$

$$\text{i.e. } y(0)=0, y'(0)=\tan(0)=0, y''(0)=1+0^2=1$$

$$y'''(0)=2y'(0) \cdot y''(0)=2(0)(1)=0, y^{IV}(0)=2[(0)(0)+1^2]=2$$

$$\text{Now, } y(x) = y(0) + \frac{y'(0)}{1!} x + \frac{y''(0)}{2!} x^2 + \frac{y'''(0)}{3!} x^3 + \dots$$

$$\log[\sec(x)] = 0 + 0(x) + \frac{1}{2} x^2 + 0(x^3) + \frac{2}{24} x^4 + \dots$$

$$\log[\sec(x)] = \frac{x^2}{2} + \frac{x^4}{12} + \dots \rightarrow \textcircled{1}$$

Differentiate  $\textcircled{1}$  w.r.t  $x$

$$\frac{1}{\sec x} \cdot \sec x \tan x = \frac{2x}{2} + \frac{4x^3}{12} + \dots$$

$$\therefore \tan x = x + \frac{x^3}{3} + \dots$$

5) Obtain the Maclaurin series expansion of  $\tan^{-1} x$  and hence obtain series for  $\sin^{-1}\left(\frac{2x}{1+x^2}\right)$

Sol: let  $y = \tan^{-1} x$

$$\therefore y' = \frac{1}{1+x^2}$$

$$\text{i.e. } \frac{dy}{dx} = (1+x^2)^{-1}$$

We have binomial series expansion

$$(1+x)^{-1} = 1 - x + x^2 - x^3 + \dots$$

$$\therefore \frac{dy}{dx} = 1 - x^2 + x^4 - x^6 + \dots$$

$$dy = [1 - x^2 + x^4 - x^6 + \dots] dx$$

Integrating both sides we get

$$y = \left[ x - \frac{x^3}{3} + \frac{x^5}{5} - \frac{x^7}{7} + \dots \right] + c$$

$$\text{Put } x=0, \quad y(0) = \tan^{-1}(0) = 0 \quad \therefore c=0$$

$$\therefore \tan^{-1} x = x - \frac{x^3}{3} + \frac{x^5}{5} - \frac{x^7}{7} + \dots$$

$$\text{Consider } f(x) = \sin^{-1}\left(\frac{2x}{1+x^2}\right)$$

$$\text{put } x = \tan \theta$$

$$\text{then } \frac{2 \tan \theta}{1 + \tan^2 \theta} = \sin 2\theta$$

$$f(x) = \sin^{-1}(\sin 2\theta) = 2\theta = 2 \tan^{-1} x$$

$$\therefore \sin^{-1}\left(\frac{2x}{1+x^2}\right) = 2 \left[ x - \frac{x^3}{3} + \frac{x^5}{5} - \frac{x^7}{7} + \dots \right]$$

6) Expand  $y = \log(1+x)$  in ascending powers of 'x' and hence S.T.  $\log\left(\sqrt{\frac{1+x}{1-x}}\right) = x + \frac{x^3}{3} + \frac{x^5}{5} + \dots$

Sol:  $f(x) = \log(1+x)$   $f(0) = 0$

$$f'(x) = \frac{1}{1+x} \quad f'(0) = 1$$

$$f''(x) = -\frac{1}{(1+x)^2} \quad f''(0) = -1$$

$$f'''(x) = \frac{2}{(1+x)^3} \quad f'''(0) = 2$$

$$f^{IV}(x) = -\frac{6}{(1+x)^4} \quad f^{IV}(0) = -6$$

By Maclaurin series,

$$f(x) = f(0) + \frac{f'(0)}{1!}x + \frac{f''(0)}{2!}x^2 + \dots$$

$$f(x) = 0 + (1)x + \frac{(-1)}{2}x^2 + \frac{2}{6}x^3 - \frac{6}{24}x^4 + \dots$$

$$\therefore \log(1+x) = x - \frac{x^2}{2} + \frac{x^3}{3} - \frac{x^4}{4} + \dots \rightarrow \textcircled{1}$$

Replace  $x$  by  $-x$ ,

$$\log(1-x) = -x - \frac{x^2}{2} - \frac{x^3}{3} - \frac{x^4}{4} - \dots \rightarrow \textcircled{2}$$

$$\text{Now } \log \sqrt{\frac{1+x}{1-x}} = \frac{1}{2} [\log(1+x) - \log(1-x)]$$

$$= \frac{1}{2} \left[ 2x + 2\frac{x^3}{3} + 2\frac{x^5}{5} + \dots \right]$$

$$\therefore \log \sqrt{\frac{1+x}{1-x}} = x + \frac{x^3}{3} + \frac{x^5}{5} + \dots$$

7) Obtain the expansion of the function  $\frac{x}{\sin x}$  in ascending

powers of  $x$ .

Sol:  $f(x) = \frac{x}{\sin x}$  and  $f(0)$  is indeterminate

$$\text{But we have } \sin x = x - \frac{x^3}{3!} + \frac{x^5}{5!} - \dots$$

$$f(x) = \frac{x}{\sin x} = \frac{x}{\left[x - \frac{x^3}{3!} + \frac{x^5}{5!} - \dots\right]} = \frac{1}{\left[1 - \frac{x^2}{3!} + \frac{x^4}{5!} - \dots\right]}$$

$$= \frac{1}{\left[1 - \left(\frac{x^2}{6} - \frac{x^4}{120} + \dots\right)\right]}$$

$$= \frac{1}{1-t} \quad \text{where } t = \frac{x^2}{6} - \frac{x^4}{120} + \dots$$

$$= (1-t)^{-1} = 1 + t + t^2 + \dots \quad (\text{by binomial series})$$

$$= 1 + \left(\frac{x^2}{6} - \frac{x^4}{120} + \dots\right) + \left(\frac{x^2}{6} - \frac{x^4}{120} + \dots\right)^2 + \dots$$

$$= 1 + \frac{x^2}{6} + \left(\frac{1}{36} - \frac{1}{120}\right)x^4 + \dots$$

$$\therefore \frac{x}{\sin x} = 1 + \frac{x^2}{6} + \frac{7}{360}x^4 + \dots$$

8) Obtain the Maclaurin series expansion of the function  $f(x) = \frac{x}{e^x - 1}$  up to 4<sup>th</sup> degree term

Sol: 
$$e^x = 1 + x + \frac{x^2}{2!} + \frac{x^3}{3!} + \frac{x^4}{4!} + \dots$$

$$e^x - 1 = x + \frac{x^2}{2!} + \frac{x^3}{3!} + \frac{x^4}{4!} + \dots$$

$$\frac{x}{e^x - 1} = \frac{x}{x \left[ 1 + \frac{x}{2!} + \frac{x^2}{3!} + \frac{x^3}{4!} + \dots \right]} = \frac{1}{1 + \left( \frac{x}{2!} + \frac{x^2}{3!} + \frac{x^3}{4!} + \dots \right)}$$

WKT  $(1+x)^{-1} = 1 - x + x^2 - x^3 + \dots$

$$\frac{x}{e^x - 1} = \left[ 1 + \left( \frac{x}{2!} + \frac{x^2}{3!} + \frac{x^3}{4!} + \dots \right) \right]^{-1}$$

$$= 1 - \left( \frac{x}{2!} + \frac{x^2}{3!} + \frac{x^3}{4!} + \dots \right) + \left( \frac{x}{2!} + \frac{x^2}{3!} + \frac{x^3}{4!} + \dots \right)^2 - \left( \frac{x}{2!} + \frac{x^2}{3!} + \frac{x^3}{4!} + \dots \right)^3 + \dots$$

$$= 1 - \frac{x}{2} + \left( -\frac{1}{6} + \frac{1}{4} \right) x^2 + \left( -\frac{1}{120} + \frac{1}{36} + \frac{2}{48} - \frac{3}{24} + \frac{1}{16} \right) x^4 + \dots$$

$$\therefore \frac{x}{e^x - 1} = 1 - \frac{x}{2} + \frac{x^2}{12} - \frac{x^4}{720} + \dots$$

$$\left( -\frac{1}{24} + 2\frac{x^3}{12} - \frac{x^3}{8} \right) x^3$$

$$\frac{(-1 + 4 - 3)x^3}{24} = 0$$

$$(a+b+c)^3 = a^3 + b^3 + c^3 + 6abc + 3ab(a+b) + 3bc(b+c) + 3ca(c+a)$$

9) Use Maclaurin series to evaluate the approximate value of integral  $\int_0^1 e^{\sin x} dx$

Sol<sup>y</sup>:- Consider  $y = f(x) = e^{\sin x}$ ,  $f(0) = e^{\sin 0} = e^0 = 1$

The Maclaurin Series is given by

$$f(x) = f(0) + \frac{f'(0)}{1!}x + \frac{f''(0)}{2!}x^2 + \frac{f'''(0)}{3!}x^3 + \dots \quad (1)$$

Diff<sup>t</sup>  $f(x)$  w.r.t  $x$

$$y' = f'(x) = e^{\sin x} \cdot \cos x$$

$$y' = y \cos x, \quad y'(0) = y(0) \cos 0 = 1$$

$$y'' = y' \cos x - y \sin x, \quad y''(0) = y'(0) \cos 0 - y(0) \sin 0$$

$$y''(0) = 1$$

$$y''' = y'' \cos x - y' \sin x - y \cos x - y' \sin x = y'' \cos x - 2y' \sin x - y \cos x$$

$$y'''(0) = y''(0) \cos 0 - y'(0) \sin 0 - y(0) \cos 0 - y'(0) \sin 0$$

$$y'''(0) = 1 - 1 = 0$$

$$y^{(4)} = y''' \cos x - y'' \sin x - 2y' \cos x - 2y' \sin x - y' \cos x + y \sin x$$

$$y^{(4)}(0) = y'''(0) \cos 0 - y''(0) \sin 0 - 2y'(0) \cos 0 - 2y'(0) \sin 0 - y'(0) \cos 0 + y(0) \sin 0$$

$$y^{(4)}(0) = -2 - 1 = -3$$

Equation (1) implies that

$$e^{\sin x} = 1 + \frac{1}{1!}x + \frac{1}{2!}x^2 + 0 - \frac{3}{4!}x^4 + \dots$$

$$e^{\sin x} = 1 + x + \frac{x^2}{2!} - \frac{3}{4!}x^4 + \dots$$

$$\therefore \int_0^1 e^{\sin x} dx = \int_0^1 \left( 1 + x + \frac{x^2}{2!} - \frac{3}{4!} x^4 + \dots \right) dx$$

$$= \left( x + \frac{x^2}{2} + \frac{x^3}{3 \cdot 2!} - \frac{3}{4!} \cdot \frac{x^5}{5} + \dots \right)_0^1$$

$$= 1 + \frac{1}{2!} + \frac{1}{3!} - \frac{3}{5!} + \dots - 0$$

$$= 1 + \frac{1}{2!} + \frac{1}{3!} - \frac{3}{5!} + \dots$$

$$\int_0^1 e^{\sin x} dx \approx 1 + \frac{1}{2!} + \frac{1}{3!} - \frac{3}{5!} \approx 1.641 \text{ (Approximate value)}$$

### Exercise:

- 1) Expand  $y = \sqrt{x}$  as Taylor series about the point  $x=1$ , up to 4<sup>th</sup> degree term.

$$\text{Ans: } \sqrt{x} \approx 1 + \frac{1}{2}(x-1) - \frac{1}{8}(x-1)^2 + \frac{(x-1)^3}{16} - \frac{5}{128}(x-1)^4$$

- 2) Obtain the series expansion of  $\sqrt{1+\sin(2x)}$  in ascending powers of  $x$ .

$$\text{Ans: } \sqrt{1+\sin 2x} = 1 + x - \frac{x^2}{2} - \frac{x^3}{6} + \frac{x^4}{24} + \dots$$

- 3) Find the first 3 non-zero terms in the Maclaurin series for  $e^x \sin x$

$$\text{Ans: } e^x \sin x = x + x^2 + \frac{x^3}{3} + \dots$$

- 4) Obtain the Maclaurin series expansion of the function  $y = \ln(\sec x + \tan x)$

$$\text{Ans: } x + \frac{x^3}{6} + \frac{x^5}{24} + \dots$$

- 5) Find the binomial expansion of the function  $\frac{1}{\sqrt{1-x^2}}$

and deduce the power series of  $\sin^{-1} x$ .

$$\text{Ans: } \frac{1}{\sqrt{1-x^2}} = 1 + \frac{x^2}{2} + \frac{3}{8}x^4 + \frac{5}{16}x^6 + \dots$$

$$\sin^{-1} x = x + \frac{x^3}{6} + \frac{3x^5}{40} + \frac{5}{112}x^7 + \dots$$

- 6) Expand  $\log(1+\sin x)$  up to the term containing  $x^4$  by using Maclaurin series.

$$\text{Ans: } \log(1+\sin x) = x - \frac{x^2}{2} + \frac{x^3}{6} - \frac{x^4}{12}$$

7) Expand by Maclaurin series  $\frac{e^x}{1+e^x}$  up to the term

containing  $x^3$

Ans:  $\frac{e^x}{1+e^x} = \frac{1}{2} + \frac{x}{4} - \frac{x^3}{48} + \dots$

8) Expand  $\sin x$  in ascending powers of  $x = \frac{\pi}{2}$  using Taylor series and hence evaluate  $\sin 91^\circ$  correct to 4 decimal places. Ans:  $\sin x = 1 - \frac{1}{2} \left(x - \frac{\pi}{2}\right)^2 + \frac{1}{4!} \left(x - \frac{\pi}{2}\right)^4 - \dots$ ,  $\sin 91^\circ = 0.9998$ .

9) Determine the Maclaurin series for the function  $y = \frac{1}{1+x^2}$ .

Hence show that  $\tan^{-1} x \approx x - \frac{x^3}{3} + \frac{x^5}{5}$ .

By using Maclaurin series for  $\tan^{-1} x$  up to 5th degree

evaluate  $\int_0^{\sqrt[4]{3}} \tan^{-1} x \, dx$ , verify the same with exact value.

Ans:  $\frac{1}{1+x^2} = 1 - x^2 + x^4 - x^6 + x^8 - \dots$

$$\int_0^{\sqrt[4]{3}} \tan^{-1}(x) \, dx \approx 0.1584$$

10) Expand  $\log(x + \sqrt{x^2 + 1})$  using Maclaurin series up to term containing  $x^3$ .
